Clean Air Power Ltd

("Clean Air Power" or "the Company")

Infrastructure Development in Australia

Clean Air Power Ltd (AIM:CAP) the developer of Dual-Fuel™ combustion technology that enables heavy-duty diesel engines to run on a combination of both diesel and natural gas notes further positive developments in Australia, one of its target markets.

BOC, the industrial gas company, announced last week a major redevelopment to triple the production capacity of its key East coast LNG (liquefied natural gas) production facility from 50 tonnes per day to 150 tonnes per day. BOC is part of the Linde Group and the upgrade of this plant follows Linde's development of another LNG plant, due to open in 2008, in Western Australia.

The BOC press release commented "The main beneficiaries will be the emerging fleet fuelling market. LNG is significantly cheaper than diesel for heavy haulage, however there has been very limited supply available constraining its use. The environment will also benefit, as LNG releases 20% less greenhouse gases compared with diesel powered trucks."

BOC is part of the Linde Group, a world leading industrial gases and engineering company operating in around 70 countries worldwide. The plant will be on line in August 2009.

In September Clean Air Power announced that Mitchell Corp Pty Ltd, one of its largest Australian customers had exercised their option to order an additional 20 units following on from their initial order of 50 units announced in January 2007.

The Company believes that this represents a clear indication that the wider market is reacting positively to the increased sales momentum being achieved by Clean Air Power's Dual-Fuel™ technology.

John Pettitt, CEO, commented "Clean Air Power is very encouraged that this global industrial gas organisation is recognising the clear benefits of LNG as a road fuel. Australia is a key market for our patented Dual-Fuel™ technology and we believe this significant investment will prove beneficial to our sales efforts on the East Coast."
